INTRODUCTION

This report is the Maine Department of Environmental Protection's (DEP) statewide Statistical Report for the Division of Response Services spill caseload in 2004. Response Services Division staff in the Bureau of Remediation and Waste Management respond to oil and hazardous material spills throughout the state and act to mitigate the damage of these events to Maine's environment, public safety, and public health. In 2004, the Division of Response Services employees included 25 Oil and Hazardous Material Specialists (OHMS), three Environmental Specialists, three Maintenance Mechanics, two Staff Development Specialists, one Health and Safety Director, and one Division Director. In 2004, Response Services filed 2,878 reports dealing with oil and hazardous incidents throughout Maine. A summary of these filings is contained in this report. These statistics examine Response Services' activity from a variety of perspectives in an attempt to highlight both Maine's environmental concerns and the varieties and numbers of situations Response Services personnel handle in a year.

The reader may notice a slight discrepancy in the total number of reports for the year. Several months are needed to compile all of the data, and the database content may change slightly during that time period. However, we at the Department are confident that these discrepancies are insignificant in regards to the statistical summaries. This report was run on May 23, 2007. Data is representative of his date.

A Response report concerns a product that is classified as an oil incident, hazardous material incident, or as a non-oil/non-hazardous incident. An oil incident or a hazardous material incident is where a known or unknown product was released to the environment. The product also may have spilled at an industrial site, but was contained and diverted to a neutralization system, or fully recovered from a containment area and put back into a production process. A non-oil/non-hazardous incident is where a known or unknown product was reported to have been released to the environment; but upon investigation none could be found or the product found did not meet the criteria of an oil or hazardous material. Therefore, the product did not fall within this division's jurisdiction or DEP was on site in an advisory role (i.e.: tank removals).

Response Services operates out of four regional offices. These are located in Augusta, Bangor, Portland, and Presque Isle. Office names are, on occasion, abbreviated:

Augusta	A
Bangor	B
Portland	P
Presque Isle	PI

Abbreviations may also be used with Incidents and Hazardous Material:

Incident	Inc
Hazardous	Haz
Materials	Mat

Spills of Interest in 2004

The next two pages list some of the interesting spills that took place during the year. The spill number, location town, and responsible party are listed. A brief synopsis of the official spill report provides basic information about the incident, including the amount spilled.

A-28-2004 Port Clyde Edward Thorbjornson

Although considered a smaller spill, 50 gallons of diesel fuel was discharged from the vent line of a grounded, listing fishing vessel. Compounding the unfortunate nature of the spill, the release occurred in the immediate vicinity of a local shellfish farm. Due to predominantly sub-zero temperatures and the sensitivity of the area, protective booming was deployed and labor intensive manual removal of ice commenced. The combination of manual labor and sea action caused the sheen to dissipate and the shellfish farm was spared.

B-41-2004 Lincoln Lincoln Pulp & Paper B-42-2004 Brewer Eastern Fine Paper

Due to financial difficulties, two mills in the greater Bangor area were forced to abruptly stop operations. With the assistance of contractors, and eventually by themselves, Bangor Responders assumed operations of the facilities during the winter months until a suitable purchaser could be found. Activities assumed also included the transport and disposal of many of the hazardous chemicals abandoned at the facilities.

B-216-2004 Athens Samavrec Inc.

A tanker truck hauling sodium hydrosulfite overturned on Route 150. An estimated 200 gallons of product was discharged onto the shoulder of the road. Much to the advantage of the environment, sodium hydrosulfite readily reacts with oxygen to form inert compounds. A small excavation was conducted to remove diesel contamination which emanated from a damaged saddle tank.

P-101-2004 Sanford Goodall Hospital

Estimated at 500 gallons or more, #4 fuel oil was discharged from a subsurface piping leak at the Goodall Hospital facility. Several remedial tactics were employed including excavation, vacuum trucks, and sorbent materials. Oil discharged followed preferential subsurface pathways subsequently impacting an abutting wetland. A passive response was deemed best for the area, replacing sorbents as needed and ultimately replanting the open water and shore with restorative vegetation.

P-371-2004 Portland Portland Tugboat LLC

As a result of human error, an estimated 1,000 gallons of #2 fuel oil was discharged overboard from the bilge of a tugboat in the vicinity of the State Pier. A multi-faceted approach to product retrieval was utilized with the employment of protective boom, sorbent materials, vacuum trucks, and skimming equipment.

P-693-2004 Limerick Lin-Cor Environmental LLC

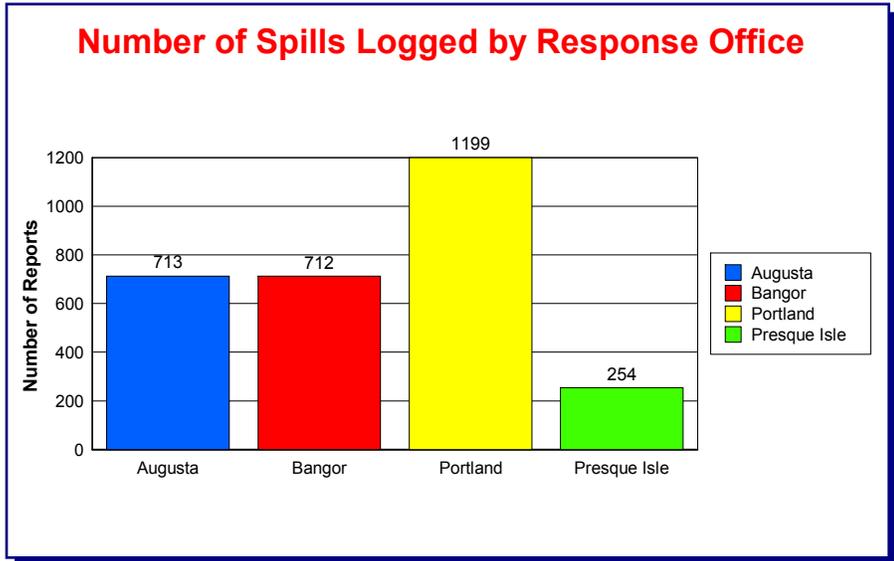

During the investigation of an anonymous citizen complaint, DEP personnel discovered over 100 drums of gasoline and mixed vehicle fluids located on a residential property. Over 90 of those drums were stockpiled in an unmarked barn (see left). DEP assumed responsibility for mitigating the issue associated with improperly stored hazardous materials by removing the contents of the drums via vacuum truck.

P-1095-2004 Scarborough ECT, Inc.

Due to a combination of factors, a heating tub of hydrogen peroxide used in a microchip manufacturing process burst into flames amongst other tubs of hazardous materials. With a collaborative effort between local fire departments, private industry, and various haz-mat personnel, the issue was mitigated with the use of Level A attire. Ventilation was introduced to the building and subsequently it was deemed suitable for entrance with downgraded personal protective equipment.

**Logged Spills
by Response Office
and Spill Type
for the year of
2004**

Augusta

Hazardous Material Incident	60	8.42%
Non-Oil/Non-Hazardous Incident	29	4.07%
Oil Incident	624	87.52%

Spill Reports by Reporter Method for 2004

Page 15

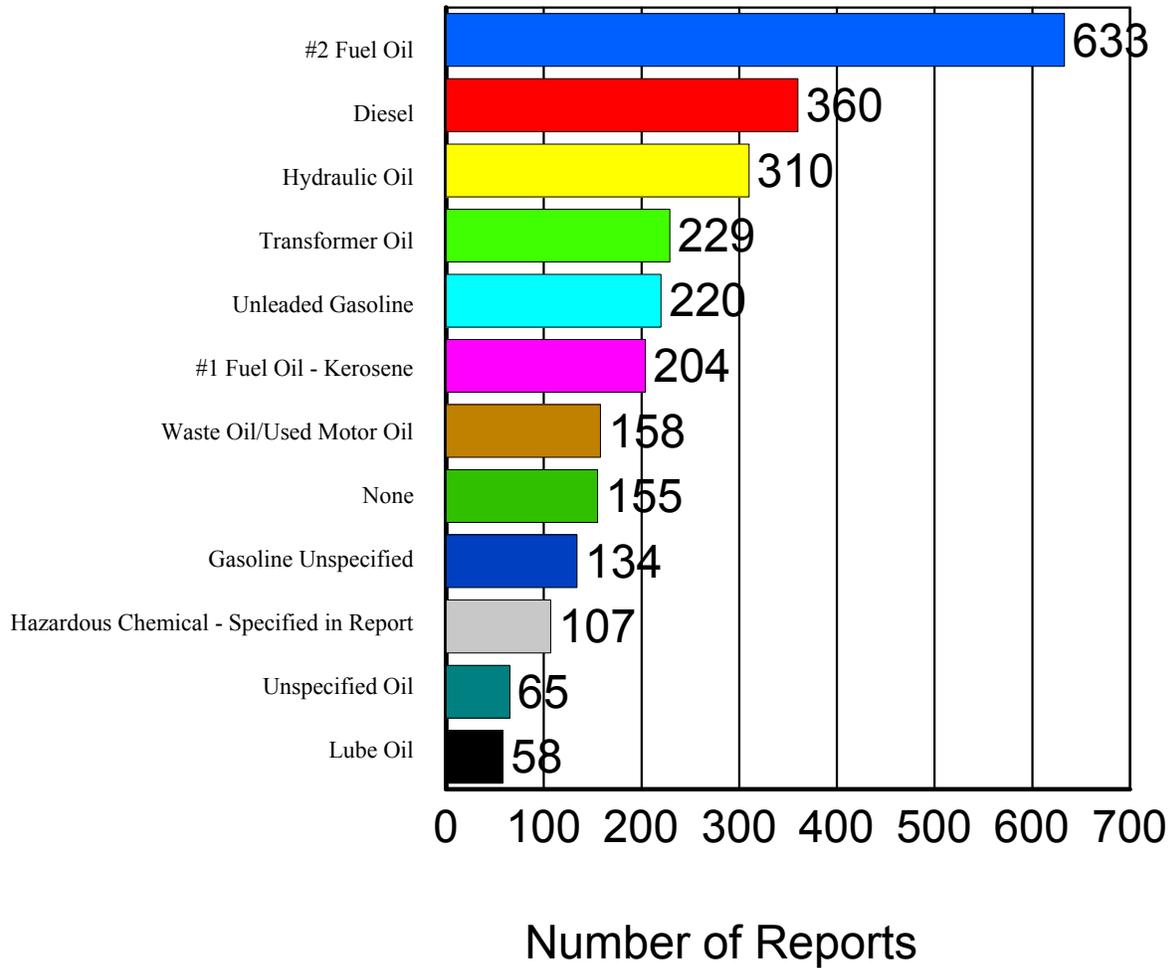

Spill Reports by Product Spilled for 2004

Product Spilled	Number of Spills	Product Spilled	Number of Spills
#2 Fuel Oil	633	Aviation Gasoline	8
Diesel	360	Unspecified Motor Fuel	8
Hydraulic Oil	310	Non-Hazardous Chemical - Specified in report	7
Transformer Oil	229	Crude Oil	6
Unleaded Gasoline	220	Leaded Gasoline	6
#1 Fuel Oil - Kerosene	204	Waste Oil (as Haz Chem)	6
Waste Oil/Used Motor Oil	158	Algae Blooms/Plant Pollen Sheens	5
None	155	Corrosive	5
Gasoline Unspecified	134	Liquors	5
Hazardous Chemical - Specified in report	107	Regular Gasoline	4
Unspecified Oil	65	#4 Fuel Oil	3
Lube Oil	58	Ammonia	3
Oil - Other - Specified in Report	58	Demolition Debris	3
Anti-freeze	45	Hazardous Chemical - Unspecified	3
Non-Chemical Non-Oil Specified in report	33	Hydrochloric Acid	3
Jet Fuel	32	Premium Unleaded	3
Mercury	30	Medical Waste	2
Transmission Oil	24	Non-Hazardous Chemical - Unspecified	2
#6 Fuel Oil	23	PCB Oil	2
Unspecified Fuel Oil	17	Non-Chemical Non-Oil Unspecified	1
Asphalt	13	Unleaded Plus	1
Sulfuric Acid	13	Vegetable Oil/Animal Fats	1
Marsh Sheen	12	Water Storage	1
Pesticide General	12		
Unknown Substance	9		

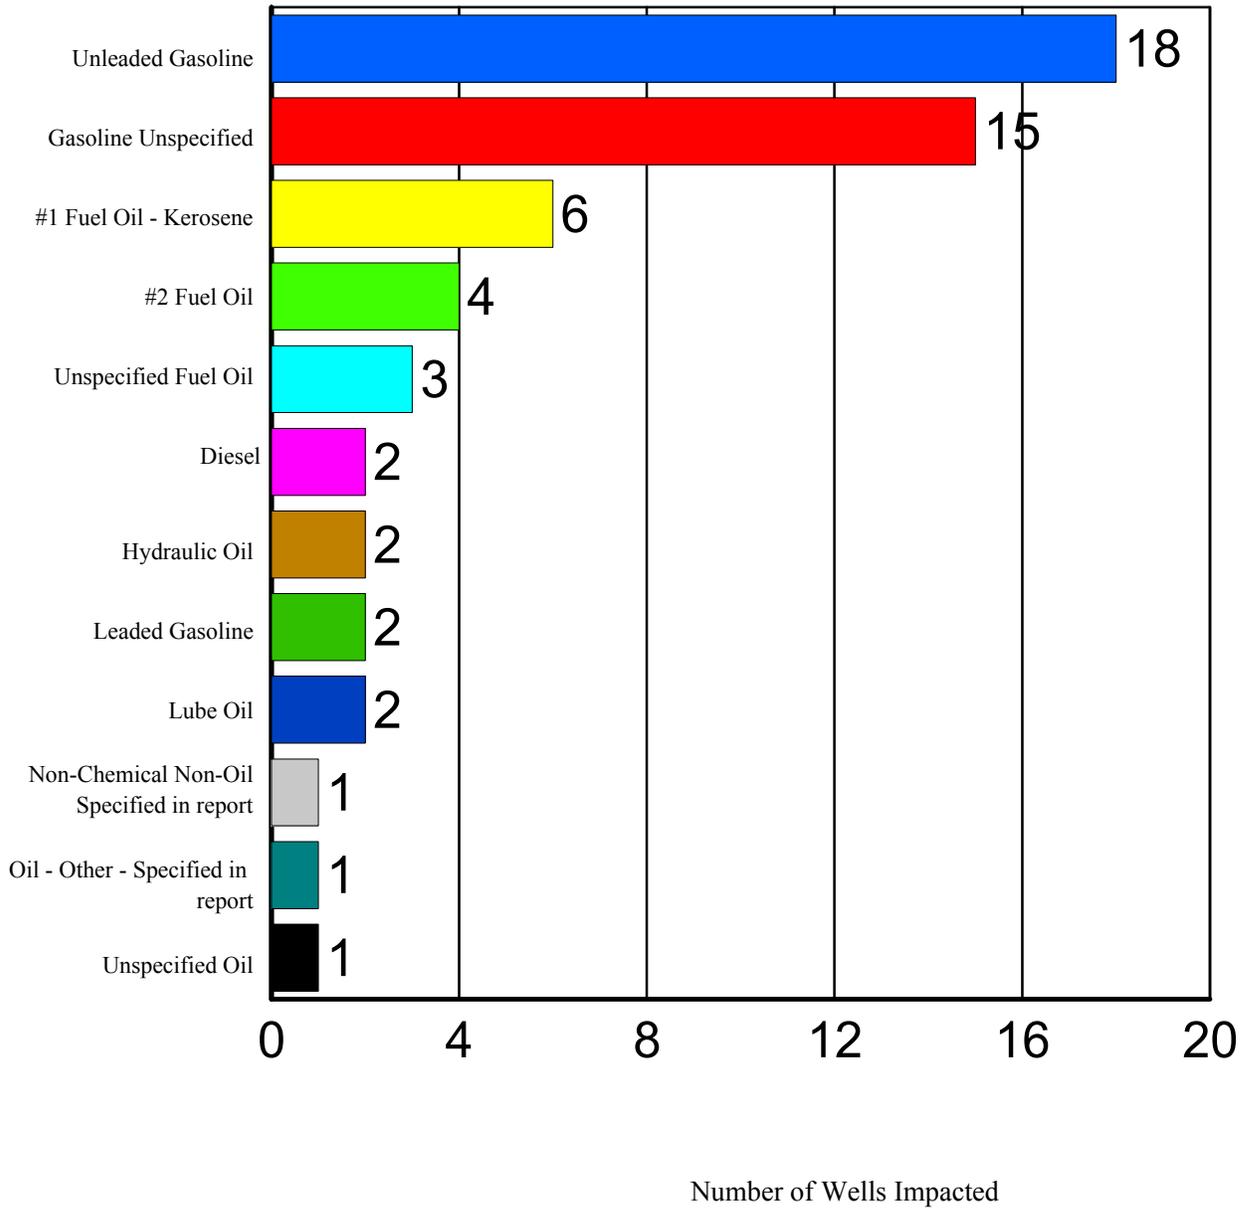

The number of spill reports reflected does not show the actual number of spills because one spill may have multiple products spilled.

Top Twelve Products Involved in Reports for 2004

The number of spill reports reflected does not show the actual number of spills because one spill may have multiple products spilled.

Top Twelve Products Contaminating Wells in 2004

Product Categories vs. Wells Impacted for 2004

<u>Product Category</u>	<u>Number of Spills</u>	<u>Number of Wells Impacted</u>
Motor Fuels	776	37
Home Heating Oils	854	13
Other Oils	921	7
Non Oil, Non Hazardous	208	1
Hazardous & NonHazardous Chemicals	248	0
Heavy Fuel Oils	26	0
Unknown	9	0
Total	3,042	58

The Product Categories above contain the following product types:

<u>Home Heating Oils:</u>	<u>Heavy Fuel Oils:</u>	<u>Motor Fuels:</u>	<u>Other Oils:</u>	<u>Hazardous & Non-Hazardous Chemicals:</u>
#1 Fuel Oil	#4 Fuel	Gasoline Unspecified	Lube Oil	Demolition Debris
# 2 Fuel Oil	#5 Fuel	Leaded Gasoline	Asphalt	Pesticide (General)
Heating Oils Unspecified	#6 Fuel	Unleaded Gasoline	Crude Oil	PCB Oil (over 50 ppm)
		Aviation Gasoline	Unspecified Oil	Sulfuric Acid
		Jet Fuel	Waste Oil	Corrosives
		Diesel	Transmission Oil	Chlorine
		Unspecified Motor Fuels		Hazardous Chemicals
		Premium Unleaded		Ammonia
				Hydrochloric Acid
				Medical Waste
				Antifreeze
				Liquors
				Non-Hazardous Chemicals
				Mercury

This table's primary purpose is to show that Home Heating Oils and Motor Fuels are the most frequent contaminants found by response services in wells (for groundwater). By this analysis, they are the greatest threat to Maine's groundwater. Close examination of the data shows that the ratio of home heating oils and motor fuel spills to well water contaminations is about 28:1. That is to say, on average, every twenty-eighth spill of home heating oil or motor fuel results in one contaminated well case.

The number of "wells impacted" may change as the data represents a "snapshot in time" when Response Services personnel complete the report. If a site is referred to Technical Services for additional investigation and remediation, the possibility exists for the number of "wells impacted" to change which isn't reflected above.

The number of spill reports reflected does not show the actual number of spills because one spill may have multiple products spilled.

Number of Wells Impacted or Threatened for 2004

Sorted by Spill Type Reported and Product Found

<u>Spill Type</u>	<u>Product Found</u>	<u>Number of Incidents</u>	<u>Wells at Risk</u>	<u>Wells * Impacted</u>
Hazardous Material Incident				
	Hazardous Chemical - Specified in report	7	10	0

Presque Isle	Hazardous Material Incident	1,108	0	0
	Non-Oil, Non-Hazardous Incident	351	0	0
	Oil Incident	4,655	0	0
	Office Total	6,114	0	0
Grand Total of All Offices Combined		360,256	3,240	16,034

NOTE: All numeric fields are BEST ESTIMATES by the OHMS involved based on the years of experience with spill events. In 2004 zero (0) Unknown and zero (0) Barrels were discharged. Units of measure are abbreviated as follows:

G = Gallons P = Pounds T = Tons

Recovery Method

The following two pages detail the amount of material that was recovered using various recovery methods. Although it would seem logical to compare the amounts of material spilled in each region to the amounts recovered, the reader should avoid this comparison. The data is incomparable because the physical form of the recovered product may be different than the spilled form. A thousand gallons of gasoline could spill onto the ground, but cleanup may involve cubic yards of soil, gallons of pure gasoline, or pounds of saturated sorbent material.

The following list shows some of the recovery methods used by the responders when they enter report data into the HOSS (Hazardous Oil Spill System) database at the Maine Department of Environmental Protection.

Category

Burning
Excavation
Filter
(Treated by) Licensed Treatment Facility
None
Other
Pumps
Remove
Skimmers
Sorbents
Treatment in Place
Vacuum Trucks

The following list details the abbreviations used on the next two pages for the amounts of material recovered.

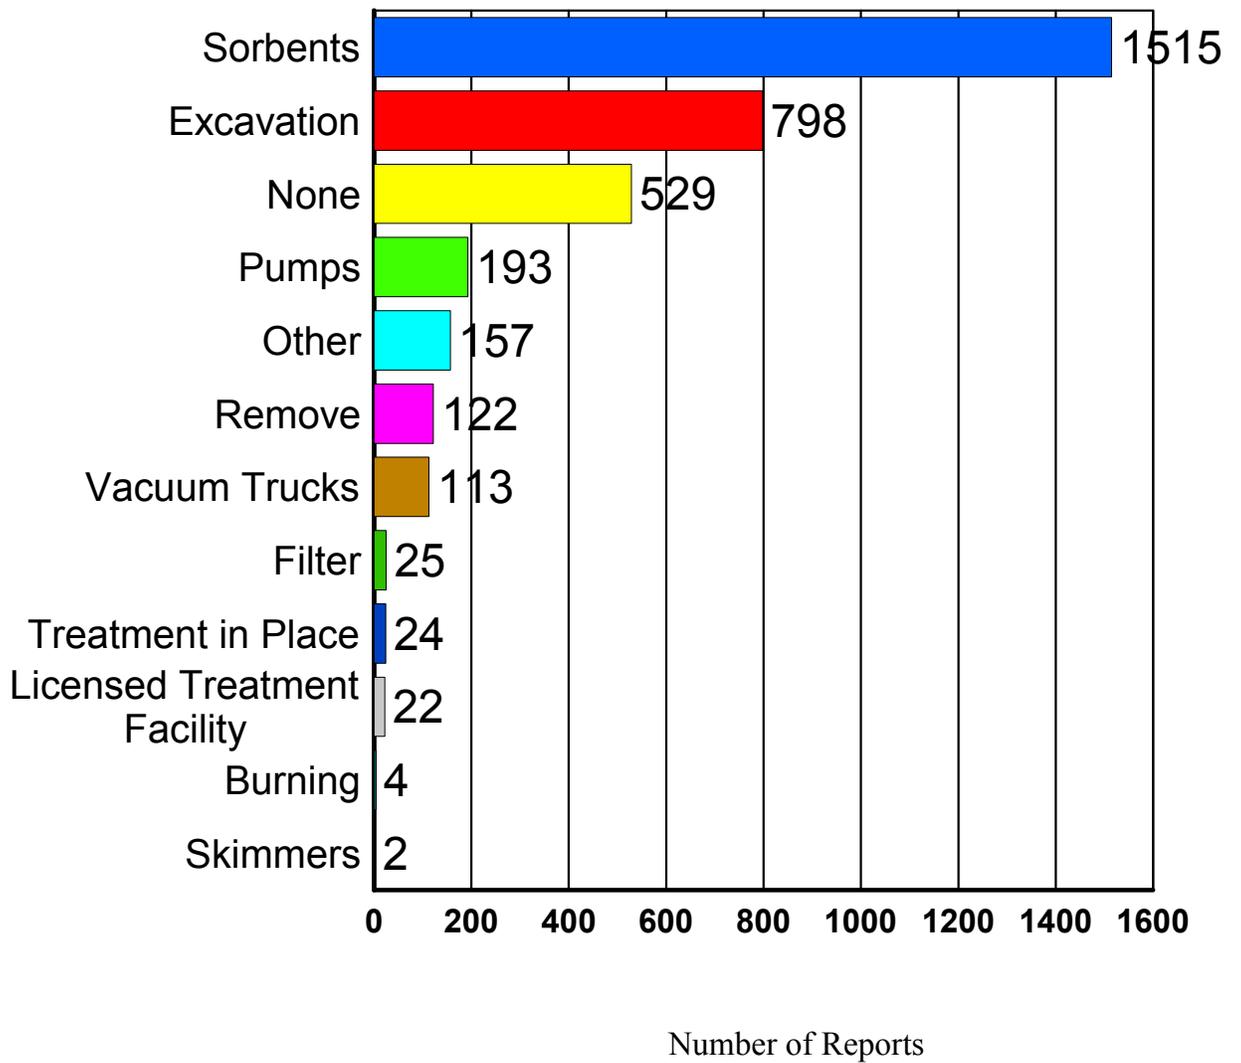

Units of Measure

B = Barrels
G = Gallons
P = Pounds
T = Tons
Y = Cubic Yards

Recovered Amounts of Spilled Material in 2004

Recovery Methods Used in 2004

The total number of recovery methods used in 2004 is greater than the total number of spill reports due to multiple recovery methods used during some spills.

Types of Hazardous Material Spilled

The following table, "Hazardous Materials Spilled in 2004", contains a summary of the best information available to Response Services as to the types of chemicals and other hazardous materials spilled during 2004. It is not always possible to identify an unknown substance in any but the broadest of terms. General characteristics such as flash point or pH are often the only factors that can be determined about an unknown without costly laboratory analysis. Given these factors, a substance may qualify as a hazardous material, yet remain an unknown.

The problem of estimating amounts spilled can also be difficult. Uncontrolled sites may have had any number of products dumped there for months or years, before anyone noticed or decided to report the event(s). Catastrophic events, like floods, result in barrels and other containers being released into the environment full or partially filled with product. These containers are often found empty or with their contents diluted. When a tank truck rolls over, a best estimate is made of the amount spilled, but the exact amount is seldom measured. If a responder is called to inspect leaking barrels at a site, it is often difficult to know how much product has already been lost into the ground. As a result of this, estimates of amounts spilled are often based on past experience with other similar spills and information that is available to extrapolate at that time. Each substance listed was discharged in at least the amount listed; usually it is reasonable to assume more than that amount was lost to the environment.

There are cases where this assumption should not be made. Most spills are industrial in nature; such as when a company either public or private has had an accident and product was lost. In general, industries know what chemicals are in what processes and in what volumes. Central Maine Power (CMP), for instance, knows how much oil is in a transformer and on those occasions when one is ruptured they make a fairly accurate assessment as to how much oil is lost. Keeping in mind the health and safety of the public as well as its employees, CMP then handles the material as though it were PCB contaminated until enough evidence is collected to indicate otherwise. Also, paper companies are quite precise in their figures of the amount of chlorine released into the atmosphere and the amount of chlorine dioxide spilled. Pure product fields, as a result of this industry scrutiny, should contain accurate data. Cases where a general family of hazardous materials is listed may well contain spill amounts that are much more than the amounts listed.

The following symbols have been utilized:

G	-	Gallons
P	-	Pounds
Y	-	Cubic Yards
B	-	Barrels
U	-	Unknown

Hazardous Materials Spilled in 2004

Material Spilled	Number Of Spills	Amount Spilled*	Unit of Measure
25% NaOH	1	2,000.00	G

Types of Facilities with Corresponding Subcategories

The graphs on the next five pages utilize the following categories and subcategories:

Business

- Business - Commercial
- Business - Farm
- Business - Industrial
- Business - Other

Government

- Government - Federal
- Government - Local
- Government - Military
- Government - Other
- Government - State of Maine

Other

- Other - Mystery
- Other - Religious
- Other - Specified in Report

Residential

- Residential - Multi Family
- Residential - Other
- Residential - Single Family

School

- School - Private
- School - Public

Terminal

- Terminal - Air
- Terminal - Bulk Plant
- Terminal - Licensed
- Terminal - Marina
- Terminal - Other
- Terminal - Service Station

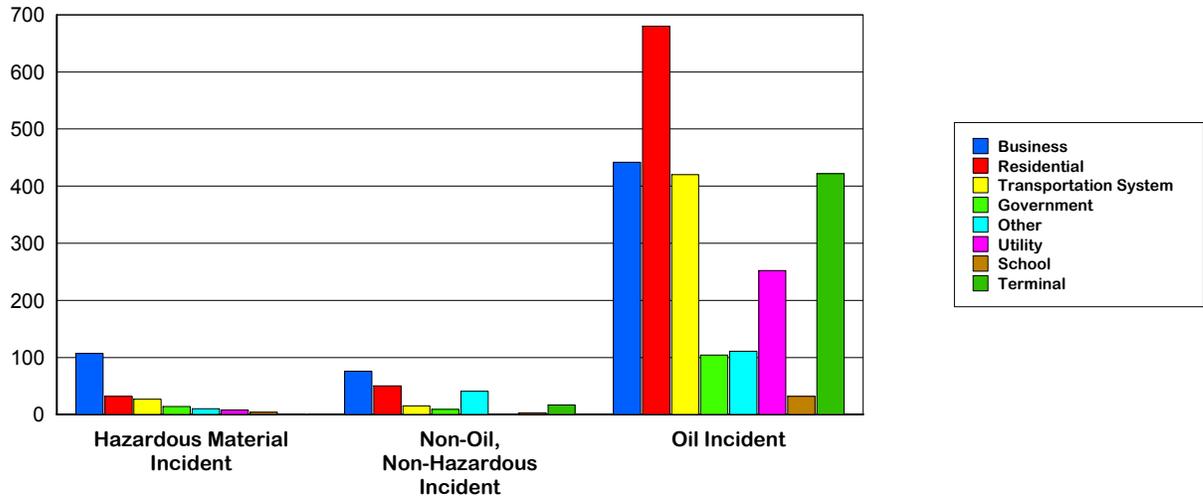

Transportation System

- Transportation - Air
- Transportation - Marine
- Transportation - Other Off-Road
- Transportation - Rail
- Transportation - Road

Utility

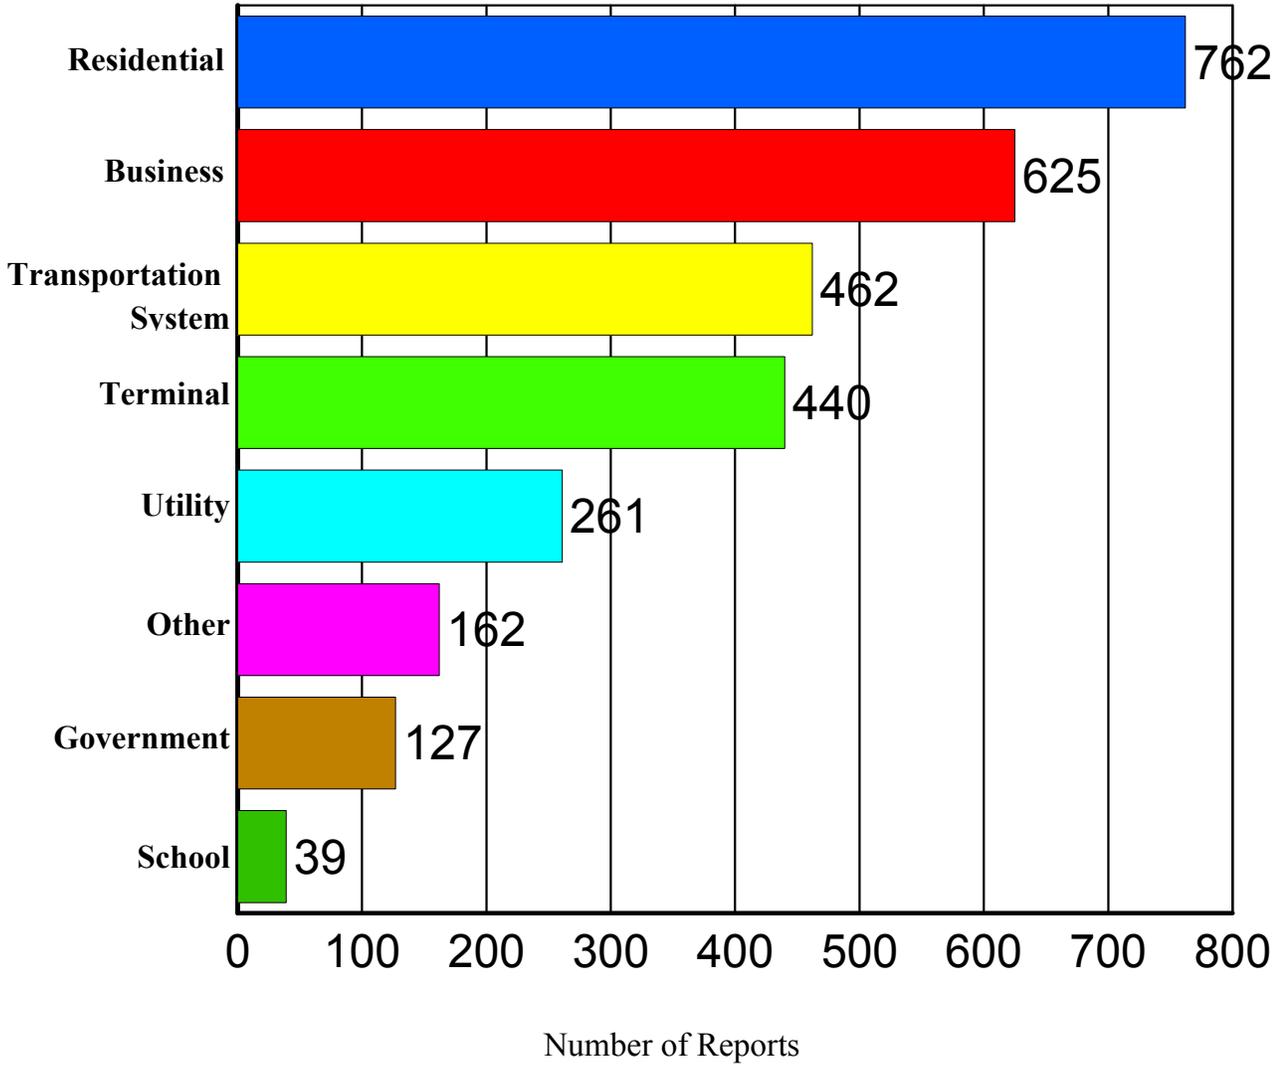

- Utility - Other
- Utility - Power
- Utility - Telecommunications

Types of Facilities Involved in Reports during 2004 by Incident Location Category

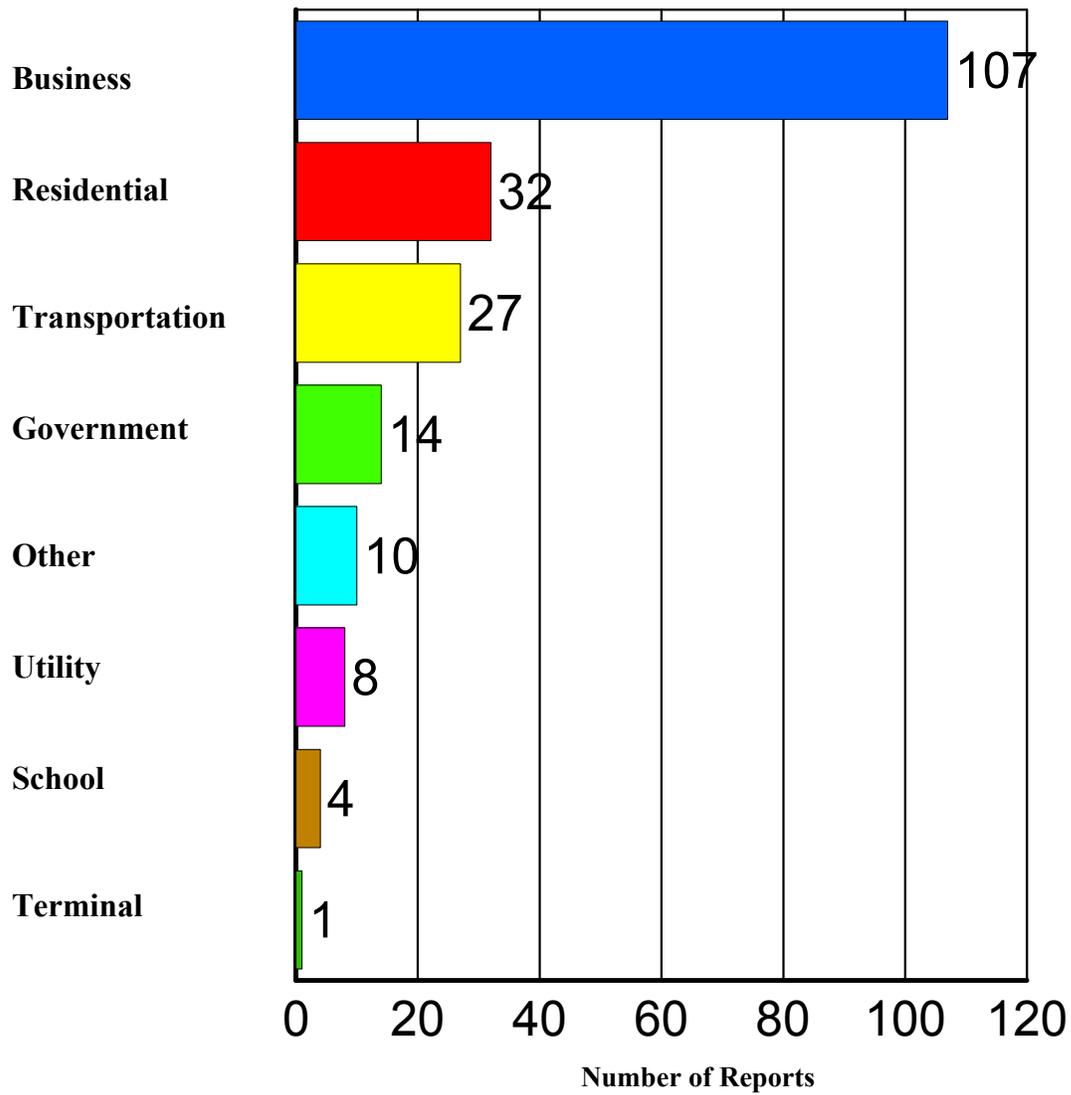

Hazardous Material Incident	203
Business	107

Explanation of Discrepancies between 2004 Maine Coastal & Inland Surface Oil Clean-up Fund and Ground Water Oil Clean-up Fund Number of Barrels

The following two pages summarize the amount of specified products that have entered, or been transferred inside, Maine borders for 2004.

When product is first transferred into the state, the DEP applies the appropriate Maine Coastal & Inland Surface Oil Clean-up Fund and Ground Water Oil Clean-up Fund fees per barrel and these fees are deposited into the funds for the cleanup of future spills. The number of barrels of product is tracked by month and product type. Occasionally, product is transferred within the State from its initial repository to another storage site. The Maine Coastal & Inland Surface Oil Clean-up Fund transfer fees again apply and the number of barrels are tracked as a second transfer. As a result, the number of Maine Coastal & Inland Surface Oil Clean-up Fund barrels may be higher than the number of Ground Water Oil Clean-up Fund barrels in any given month.

The next two pages involve the following product types:

- Kerosene #1
- Fuel Oil #2
- Fuel Oil #6
- Unleaded Regular
- Aviation
- JP-4 (Jet Fuel)
- JP-1 & Jet-A (Jet Fuel)
- Unleaded Super
- Diesel
- Asphalt
- Crude Oil
- Other Petroleum Products:
(Mineral Oil, Hydraulic Fluid, etc)

Ground Water Fund Barrels of Product Transported/Transferred into Maine for 2004

<u>Product</u>	<u># of Barrels</u>
Kerosene #1	1,793,126
Fuel Oil #2	12,058,721
Fuel Oil #6	5,993,843
Unleaded Regular	20,743,157
Aviation	49,062
JP-4 (Jet Fuel)	94,891
JP-1 & Jet-A (Jet Fuel)	1,540,889
Unleaded Super	882,044
Diesel	5,570,516
Asphalt	998,652
Crude Oil	159,720,283
Other Petroleum Products: (Mineral Oil, Hydraulic Fluid, etc)	24,831
<u>Total Barrels</u>	<u>209,470,015</u>

Surface Fund Barrels of Product Transported/Transferred in Maine for 2004

<u>Product</u>	<u># of Barrels</u>
Kerosene #1	1,793,133
Fuel Oil #2	12,147,110
Fuel Oil #6	6,761,530
Unleaded Regular	20,743,157
Aviation	49,062
JP-4 (Jet Fuel)	94,891
JP-1 & Jet-A (Jet Fuel)	1,540,889
Unleaded Super	882,044
Diesel	5,597,874
Asphalt	998,652
Crude Oil	159,720,283
Other Petroleum Products: (Mineral Oil, Hydraulic Fluid, etc)	24,831
<u>Total Barrels</u>	<u>210,353,456</u>
